

Fare Logistics Configuration Management

The Configuration Management software allows the transit agency to customize the use of the Farebox and reporting software. This powerful tool provides secure and controlled access to the reporting system and all its functionality, including scheduled uploads, login maintenance, and driver display customization.

The most impressive feature of Fare Logistics' Configuration Management Software is undoubtedly its flexibility. Not only can the transit agency configure which users have access to which functions, the system also allows the transit agency to design and mold the Farebox driver display to their specific needs and requirements without intervention from Fare Logistics.

The graphic user interface has been redesigned and coded by the newest Microsoft development platform. It is more Windows XP oriented, transparent and straightforward so that all the technical details are handled in the background by the program.

Features:

- Simple menu options;
- Logging of access to transactions, data and settings for added security;
- Flexible configurability; and
- Add-on tools.

Specifications:

- Uses Microsoft SQL 2005 Server as a database;
- Runs on Windows 2000, XP, 2003 Platforms.
